

ABSTRACT

5 A compound favored with low viscosity, capable of
providing a cured product having high refractive index,
and suitable for application to optical materials,
including plastic lens material, radical polymerizable
flame retardant and the like, as well as a process for
producing the compound, a plastic lens composition using
the compound, a plastic lens obtained by curing the
10 composition and a process for producing the plastic lens.
A novel aromatic ring-containing polyvalent (meth)allyl
ester derived from a polyvalent carboxylic acid of
trivalent or greater valent is employed.
